Last modified: Saturday 15th February, 2025 at 20:02.

1 Dados

Daqui a pouco vou colocar um dicionário dos arquivos no [repositório](#).

1.1 Violência

Menores níveis hierárquicos: CISP¹ e UPP.

Tem todos os tipos de crimes possíveis por CISP e UPP, série mensal (tem o dicionário de variáveis no [./docs](#) do repositório. Coloquei o dataset geral e o de feminicídio no [./data](#) já.

¹Do [MPRJ](#): “As Circunscrições Integradas de Segurança Pública - CISP, correspondem às áreas territoriais de atuação e responsabilidade conjunta das delegacias distritais da Secretaria de Estado de Polícia Civil (SEPOL) e das companhias integradas da Secretaria de Estado de Polícia Militar (SEPM).”

1.2 Tiroteios + mapa de controle da cidade

Instituto Fogo Cruzado + GENI/UFF.

Tô tentando descobrir como extrair o mapa (se tiver como; se der pra pensar num experimento natural, extração manual não seria problema). Coloquei dados que eu tô usando de tiroteio no Rio de 2019-2020 por enquanto, mas dá pra puxar pra parte da Grande Rio (e algumas outras regiões metropolitanas) bem fácil.

1.3 Outros

Não sei se vai ser útil, mas coloquei dados de quais cidades tomaram quais medidas de quarentena no Brasil e dados de COVID do DATASUS.

Tem o shp da prefeitura do Rio também (inclui algumas outras cidades, a maioria na Baixada).

2 Metodologia

- Dá pra agrupar os dados de violência a nível de CISP ou UPP pra regressão.
- Literatura (ver apêndice): pra controlar endogeneidade de presença policial, usam coincidência de partido de prefeito-governador, painel GMM (lagged vbs; também pra inércia do crime); pra erro de mensuração dos crimes reportados, modelam o erro como aleatório; pra inversão de causalidade, uso de transporte.

Algumas variáveis independentes (tô vendo o que eu consigo a níveis mais baixos que município):

- IDH, medidas de educação, renda, analfabetismo, pobreza extrema, desemprego, raça, população (+ população entre 15-24 anos), domicílios liderados por mulheres, taxa de urbanização, taxa de crescimento do produto, idade, prior offenses

Outras que eu pensei:

- Pra população entre 15-24 (ou até 29), podia colocar gênero também;
- Experimentos naturais: instalação das UPP $\rightsquigarrow$ ver se crime deslocou (e.g. pra Niterói); controlar pra impedimentos geográficos ou da malha rodoviária pra tentar extrair variação exógena
- Hipótese: várias facções em uma só área na regressão deviam gerar mais conflitos organicamente. Se só duas facções: ver se existe informação sobre acordos de controle compartilhado (e.g. CV + milícia).
- Algumas IVs pra desigualdade poderiam ser altura + elevação das construções (casas na favela têm menos andares, ficam mais em morros), arranjo das ruas (não costumam ter um grid planejado na favela).
 - Parece overkill, mas talvez sirva de alguma coisa se a gente conseguir dados de desigualdade pra áreas agregadas pelo CPS etc.

3 Apêndice

Alguns artigos sobre o assunto. As tabelas só servem pra mostrar quais foram as variáveis independentes e alguns resultados sobre os coeficientes delas.

3.1 *The Socioeconomic Determinants of Crime in Brazil*: the role of spatial spillovers and heterogeneity (2020)

TABLE 2

Factorial loadings and commonality

The values in parentheses are the p-values of the variables. ** Mortp = terminology for intentional homicide,. Mortp_1 = First lag of Mortp.

Nível: estadual.

Polícia controlada com GMM, painel. Usam Granger etc. pra ver se tem inversão (não acham).

3.4 Inequality and Violent Crime (2002)

Nível: países.

“To account for criminal inertia, we need to work with a dynamic, lagged dependent econometric model.”

[...]

“We address the problem of joint endogeneity by employing an instrumental variable procedure applied to dynamic models of panel data. This is the GMM estimator that uses the dynamic properties of the data to generate proper instrumental variables.” (**lagged vbs**)

[...]

“To control for measurement error, we model it as either random noise or a combination of an unobserved country-specific effect and random noise.”

3.6 *Economic Inequality, Relative Deprivation, and Crime: An Individual-Level Examination*

Nível: individual.

“The main independent variable is relative deprivation. Several indices have been offered to measure relative deprivation, of which the most popular are currently the Yitzhaki index and income rank. The former’s theoretical basis is that what matters in income comparisons is the magnitude of differences between individuals; the index takes this into account by calculating the average difference between an individual’s income and those of all other individuals with higher incomes. The income rank index, by contrast, is based on the idea that people lack knowledge of precisely how much others earn, and so what matters is their ordinal position, or rank, within a given group. Following this, and given that the income rank measure is correlated more strongly than the Yitzhaki index with negative outcomes, we operationalized relative deprivation using this measure.”

Variable	Property crimes			Violent crimes		
	HR	RSE	CI	HR	RSE	CI
Lag relative deprivation	1.58***	0.07	1.44, 1.74	1.48***	0.05	1.38, 1.58
Log income	0.97***	0.01	0.97, 0.98	0.99***	0.01	0.98, 0.99
Log spousal income	0.98***	0.01	0.97, 0.98	0.99***	0.01	0.98, 0.99
Number of prior offenses	1.78***	0.02	1.75, 1.82	1.54***	0.01	1.52, 1.56
Male (1 = Yes)	4.51***	0.16	4.21, 4.83	9.53***	0.31	8.93, 10.16
Age	0.97***	0.01	0.96, 0.97	0.97***	0.01	0.97, 0.97
Education years	0.87***	0.01	0.86, 0.88	0.86***	0.01	0.85, 0.87
Jewish (1 = Yes)	0.92	0.04	0.84, 1.01	0.68***	0.02	0.65, 0.72
Married (1 = Yes)	0.55***	0.02	0.51, 0.60	0.89***	0.03	0.83, 0.94
Born in Israel (1 = Yes)	0.75***	0.03	0.70, 0.81	0.56***	0.01	0.53, 0.59

3.7 Outros

3.7.1 *Inequality and Crime* (2000)

Teoria econômica do crime explicaria crime à propriedade, mas não crimes violentos.

3.7.2 *Inequality and Violent Crime: Evidence from Data on Robbery and Violent Theft* (2005)

Efeito de desigualdade no crime é dependente de FE de cultura.
